ABOUT OUR RDISA
(Radhiant Diagnostic Imaging South Africa Inc)A dynamic radiology healthcare company that is dedicated to delivering the highest standards of radiology services to underserved regions and their medical practices. The company, which was founded by a South African radiologist in the Eastern Cape, also provides a range of supporting services through its partnership with Radhiant Group – Radhiant Technology, Radhiant Consulting, and Radhiant Investment Services. The goal of Radhiant Group is to empower communities and medical practices with the resources and support they need to deliver first-rate patient care at their convenience.

RDISA, a partner of Radhiant GroupStriving to be ahead in everything we do

VISION, MISSION & VALUESRDISA is committed to leading the way in patient-centric care by providing under-resourced regions access to imaging and interpretation services in their own areas. Focus is placed on the patient's convenience and support of local medical practices, which find sending patients for regular screening tests impractical as equipped screening facilities are simply too far for routine patient travel.

Our Missionto provide under-resourced regions with patient-centric radiology services, ensuring access & convenience for rural communities.

Our ValuesEthical, quality-driven care, proactive innovation & support for rural well-being in healthcare.

What We DoProviding under-resourced regions access to imaging and interpretation services in their own areas.

Our AimThe aim of the company is to ensure that rural communities receive the highest standards of care.

Our PromiseRDISA will ensure the service is brought to the patients and communities rather than the opposite and obsolete current method.

FREQUENTLY ASKED QUESTIONSRead through a couple of commonly asked questions about Mammograms.

Why should I have a mammogram?Extensive research has shown that early detection with routine/annual mammograms will improve survival rate of

5 years by 100%.Aid in the early detection of cancersCan detect cancers less than 2 mm in size- which respond well to treatment.Have conclusively shown that annual screening mammography, over the age of 40 yrs., significantly increases survival and decreases morbidity from breast cancer.When should screening Mammography commence?Routine screening mammography, for the general female public, should commence at 40 years of age (except where there is a significant family history) and be performed annually thereafter.However, where there is a family history of a first-degree maternal relative having been previously diagnosed with breast cancer, the screening should commence 5 years prior to the age of diagnosis of the relative but not commence earlier than 25 yrs. of age and older than 40 yrs. of age.When is it recommended not to have a mammogram?If you are pregnant and under 35, then it will be suggested that you have an Ultrasound rather than a mammogram. How painful is a mammogram?With the advent of ergonomic improvements in mammography units and improved imaging techniques, this factor is far less of a problem now than before.Everyone experiences mammograms differently. Some women may feel pain during the procedure, and others may not feel anything at all.Most women feel some discomfort during the actual X-ray process. The pressure against your breasts from the testing equipment can cause pain or discomfort but it will never be beyond what you are capable of dealing with.
